

BECOME AN EXPERT DATA ANALYST WITH OUR DAX CALCULATE TRAINING

According to Gartner, *"Power BI is the leading Business Intelligence and Analytics solution. It provides information insights and collaboration to enable fast, data driven decisions."*

Power BI includes a powerful expression language called DAX, but is often underutilised due to the extensive flexibility and customisation possible within the expressions.

One such example is the use of the CALCULATE function, which enables users to provide detailed conditions when calculating custom measures.

Furthermore, priorities may be assigned to expressions depending on existing Slicers and other active Filters, to provide extremely flexible analysis and insights.

We have developed a highly specialised training programme to cover these concepts and ensure your team members are ready to start exploring the full potential of DAX expressions.

DAX CALCULATE TRAINING TOPICS

DAX Calculate (1 Day)

- DAX Expressions
- Calculated Columns
- Calculated Dimensions
- DAX Patterns
- Calculation Contexts
- Introduction to CALCULATE
- Filtering with CALCULATE
- Advanced use of CALCULATE

This training programme is focussed on Advanced users of Power BI (who have completed our Advanced training course)
The day consists of either a single six hour in-person training session or alternatively two three hour online training sessions.

The training sessions are interactive sessions where you are encouraged to participate in hands-on exercises. They are not merely demonstrations.
**This is a complete package and cannot be split into individual portions.
